

## 40513262 - Reflection on Courses:

### Course 1: “Manage your time.”

This course taught me content that I mostly experienced and knew about. But it was nice knowing that it could yield some positive results if one were to do the time and do it routinely.

### Course 2: ”Git started with GitHub”

I already had some experience with GitHub in one of my other modules. Thus, I was already familiar with how GitHub works and how to do the basics. Although it was only the GUI side and not the command line side of GitHub.

### Course 3: “Git expert 4 hours”

Seemed like a good course to do if one wanted to know more about GitHub. I already knew most of the topics since we had the option to use GitHub for one of our projects in a previous module. But this course would be effective for people wanting to learn more about GitHub and the core Git.

### Course 4: “Project and Project management”

I was not a very big fan of this course. I mostly speed-read the content as the slides were available and it was hard to hear what he tried to explain as the accent was thick at times and microphone not clear at times. But using software to plan tasks seems like a good, organized way of approaching projects.

### Course 5: “Cisco Packet Tracer”

This course taught me a lot of things and valuable at that. It taught me how a network would typically work and what settings would be typically set. It is very detailed and truly acts as a simulator and would help with relevant projects.
